

# Observing the Ocean:

## A changing Paradigm

### A vision for Operational Oceanography

Jean-François Minster

*Ifremer*

# Recent evolutions

- ❑ **Increasing perception of ocean issues**  
climate – resources – usages - environment
- ❑ **Knowledge and technology**  
allowing the establishment of operational systems (in particular WOCE, TOGA, JGOFS, LOICZ, CLIVAR...)
- ❑ **Demonstrations of preoperational systems**

# Ocean issues

## eg coastal ocean (GOOS)

- ❑ Improved security and efficiency of usages of coastal oceans
- ❑ Mitigation of natural hazards
- ❑ Detecting and monitoring – Impacts of climate change
- ❑ Reduction of risks for human health (HAB, virus)
- ❑ Protection and restoration of marine ecosystems
- ❑ Sustainable exploitation of marine resources
- ❑ Military operations

*Many diverse issues*

# Ocean systems eg coastal ocean

- ❑ Monitoring systems for risk assessment
- ❑ Impact study systems (eg coastal management)
- ❑ Prediction systems

*Physical and ecosystem descriptions*  
*Complementary systems*

# Les réseaux de surveillance RNO, REPHY et REMI

## □ RNO : Couverture géographique

- Qualité générale des eaux
- ▲ Contaminants (coquillages et sédiment)
- Effets biologiques (poissons, coquillages)

# Les réseaux de surveillance RNO, REPHY et REMI

## □ REPHY : Couverture géographique

- 1 à 4 points de prélèvement du suivi REPHY  
Total : 33 points flore  
140 points coquillages  
62 points échantillonnés toute l'année

# Les réseaux de surveillance RNO, REPHY et REMI

## ☐ REMI : Couverture géographique

- Jusqu'à 1996 : 1 à 6 points de prélèvement de la surveillance REMI (total : 345 points)

Depuis 1997 : 322 zones classées, 358 points

# A 4D operational depiction of the ocean, coherent with satellite and in situ observations

# An international effort: the high-precision satellite altimetry program

# CORIOLIS 2004 data set

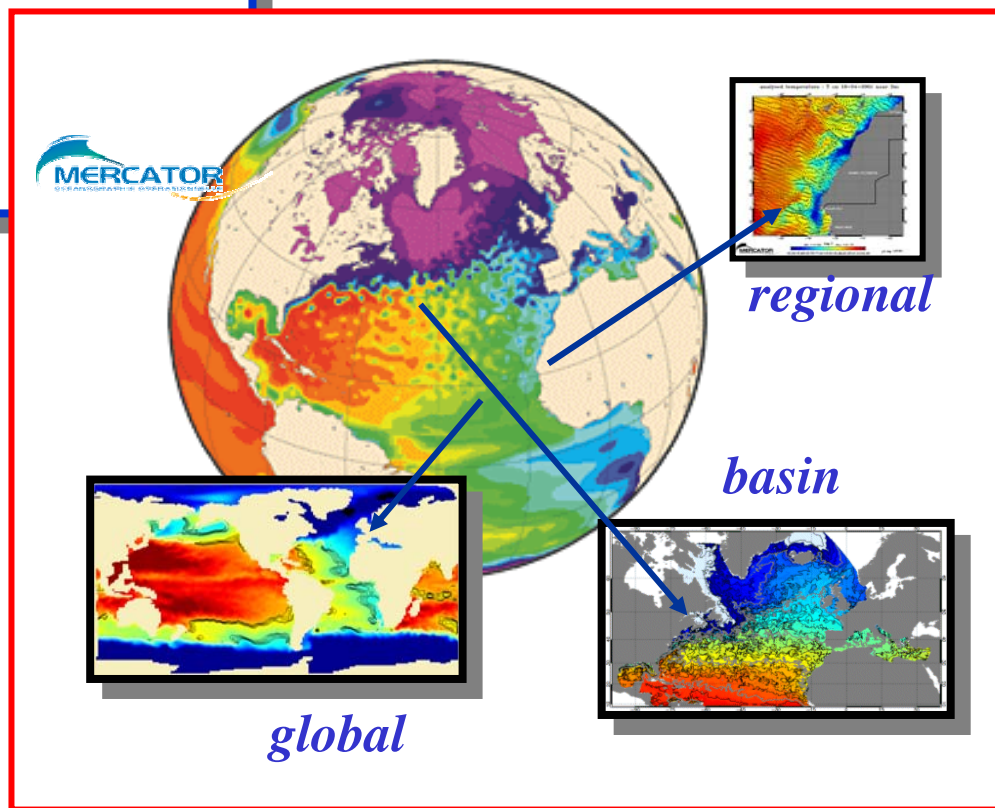

# Integrated Oceanography

JASON, ...

MERCATOR

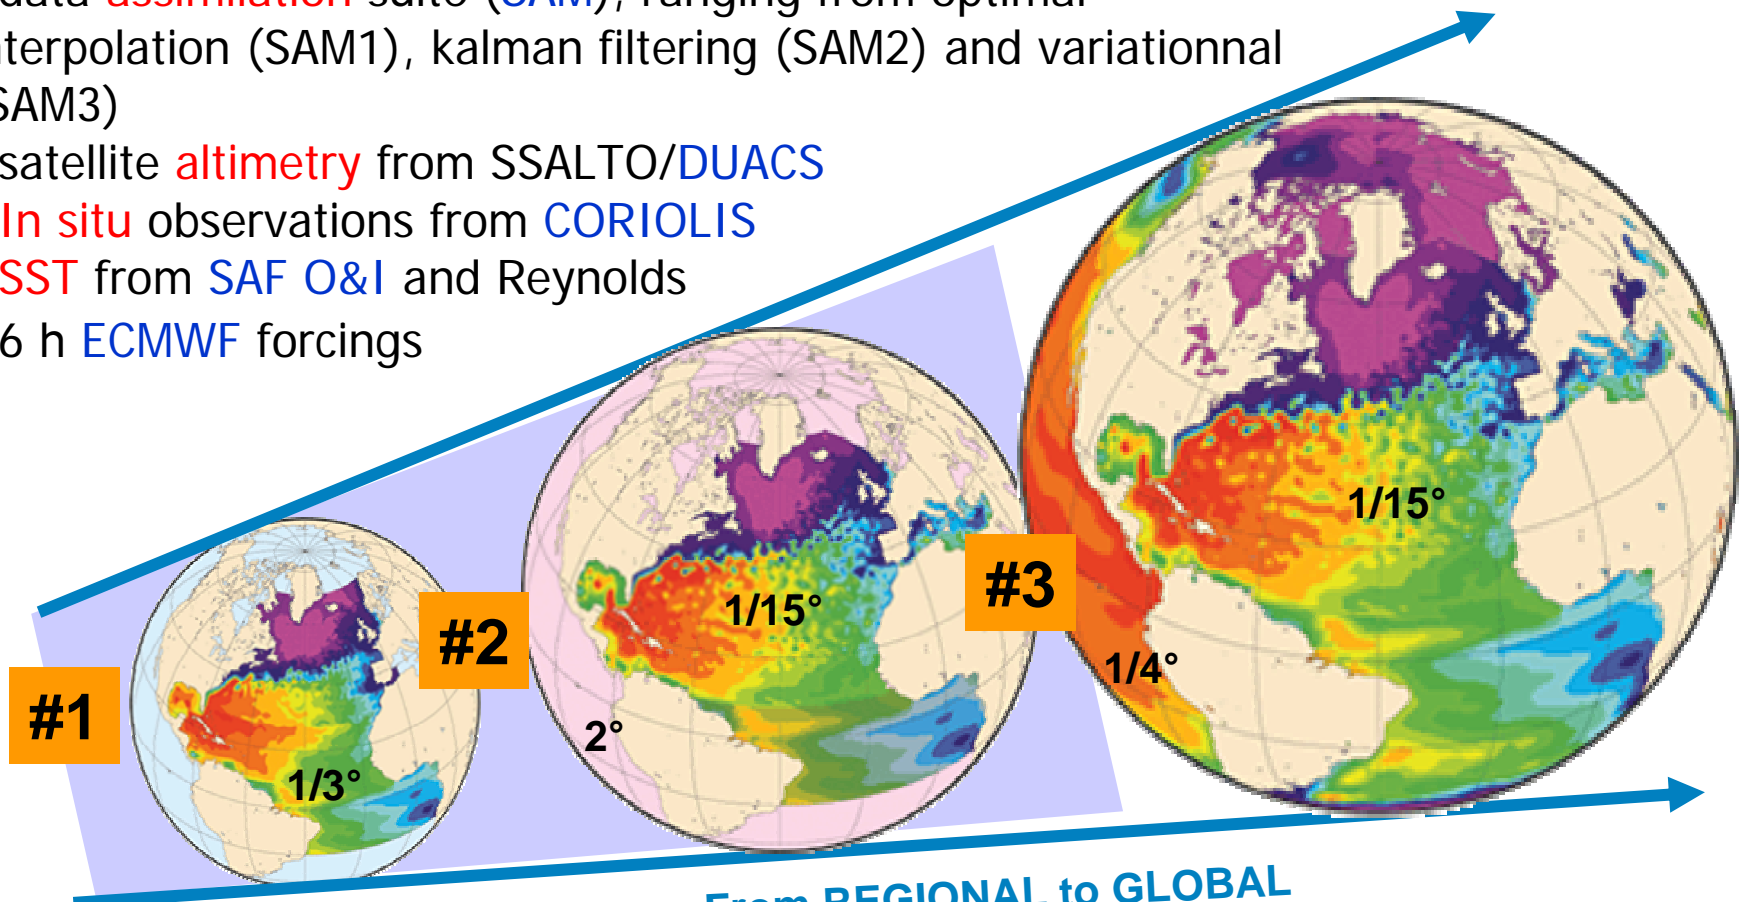

CORIOLIS

- ❑ High Resolution Global to Regional **Ocean Monitoring and Forecasting**
- ❑ Operational Assimilation of **Satellite and In Situ Ocean Observations**
- ❑ **Serving** research, state (military and civilian) service, and commercial needs

# Main components and Implementation Plan

- ocean **modélisation**, using the european **OPA** code
- data **assimilation** suite (**SAM**), ranging from optimal interpolation (**SAM1**), kalman filtering (**SAM2**) and variationnall (**SAM3**)
- satellite **altimetry** from **SSALTO/DUACS**
- **In situ** observations from **CORIOLIS**
- **SST** from **SAF O&I** and Reynolds
- 6 h **ECMWF** forcings

Strategy:

From REGIONAL to GLOBAL  
From R&D to OPERATIONAL  
From Altimetry to MultiData

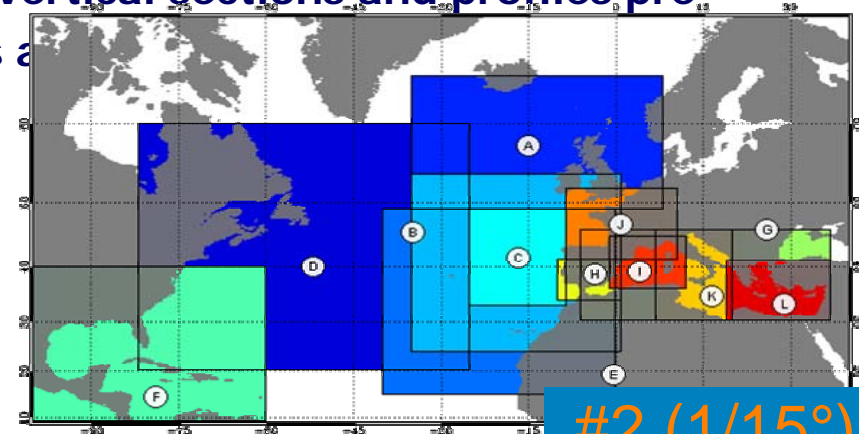

Ecole d'Études Oceanographiques Operationnelles GODAE – 20 septembre 2004

# Ocean monitoring and forecasting

3 years of continuous experience of routine assimilation of NRT data

- Weekly bulletin : a full 4D description of the ocean : Temperature, Salinity, Currents and Transports, Sea Surface Height, Mixed layer depth, ...
- Provided in real-time (Nowcast and 2-week forecast) and on a hindcast mode (Reanalysis)
- More than 3 years of continuous operations (171 bulletins)
- The « 3 validation loops » organization well assessed : short loop (ocean forecasters : 3 h-3d) ; medium loop (Mercator R&D team : ~ 3 months) ; research loop (SWT : 1-3 years)
- Range of Ocean products : Regional zooms & vertical sections and profiles pre-defined (2000 maps/week), and 4D outputs ; associated to forecasters services

- More than **#1 (1/3°)**

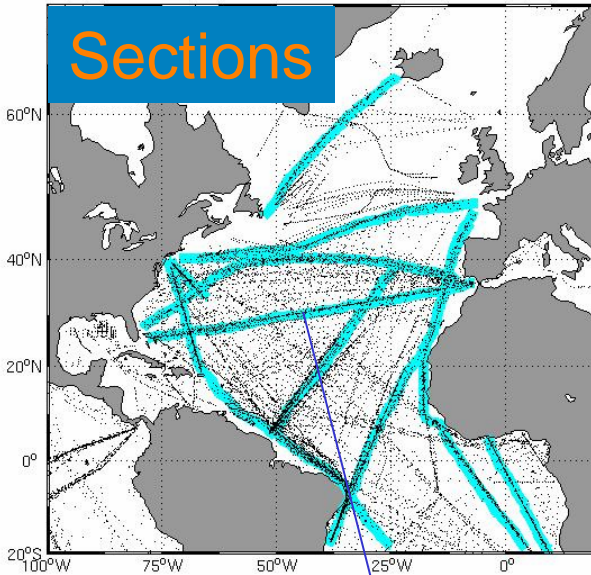

**43 levels of depth**

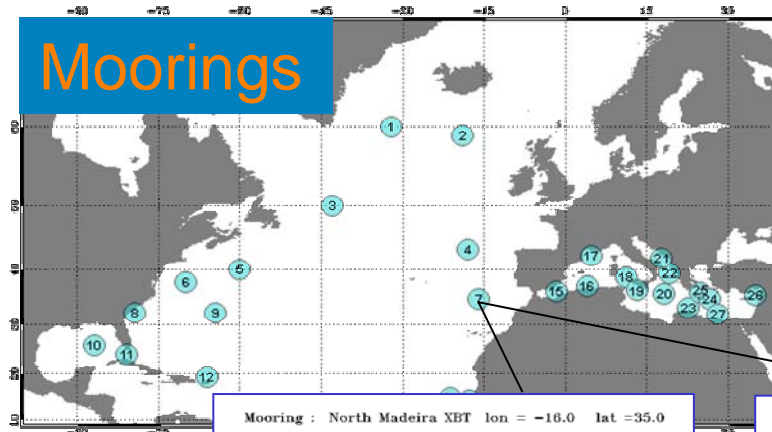

20 septembre 2004

# Cost benefit ratio

## eg Gulf of Marine Ocean observation System

### Go MOOS

#### ❑ Users direct the organisation

- Commercial mariners
- Coastal resource managers
- Scientists
- Educators
- Search and rescue teams
- Public health officials

#### ❑ Potential annual benefits

- 33 M US \$
- if 1% in lives-at-risk saved (90 to 91%)
  - ❖ 6 lives per year

# Architecture of operational Oceanography

- ❑ Long life « overall system »
  
- ❑ « Subsystems » (global, regional etc...)
  - relying upon « components » transverse to subsystems
  - with varying life cycles
    - ❖ incremental evolutions
  - both research-pushed and technology-pulled
  
- ❑ Implies
  - Integrated subsystems
    - not sensitive to evolutions of components
  - Minimum standardisation
    - but clear interfaces

***A system of systems  
(GEO framework)***

# How to elaborate a manageable system

## Some potential principles

- ❑ Elaborate a limited number of « integrated subsystems » satisfying « similar » needs and requirements with limited sets of products
- ❑ Decompose the « overall system » in a limited set of components in order to increase synergies
- ❑ Describe precisely interfaces between components and each sub-system
- ❑ Define the overall governance identifying :
  - political ownership (global and regional)
  - strategic activity
  - policy and technical definition
  - implementation entities
    - ❖ for components
    - ❖ subsystems

# Conclusion

## □ Operational Oceanography

an identified set of needs

an ongoing development and implementation

a building up of governance  
on global  
and regional scales
