Report WOCEMET 96-13

Version 2.0

Addendum:

Member's of the WOCE Hydrographic Project Office (WHPO) and WOCEMET met at the 13th Data Products Committee (DPC) meeting in College Station, TX to discuss reconciliation of the WOCE cruise line designators. This was done in anticipation of the future release of version 3 of the WOCE global data set, and resulted in changes to several WOCE cruise line designations.

On December 21, 2000 WOCEMET removed the WOCE designation for cruise AR_18_/04. The quality control information for this data has been left in this report for the user, but please note that the line previously known as AR_18_/04, is NOT a WOCE cruise line.

Introduction:

The data referenced in this report were collected from the research vessel Aranda (call sign: OHLV; Data source: Finnish Institute of Marine Research/J Launiainen) automated weather station(AWS) for 2 different WOCE cruises. The data were recieved in electronic format and converted to a standard FSU format. Then they were preprocessed using an automated data checking program. Next a visual inspection was completed by a Data Quality Evaluator who reviewed, modified and added appropriate quality control (QC) flags to the data. Details of the WOCE QC can be found in Smith et al (1996). The data quality control report summarizes the flags for the Aranda AWS data, including those added by both the preprocessor and the analyst.

Statistical Information:

The data set from the Aranda was expected to include observations taken every hours from 2 cruises. The start and

end dates, the number of records and values and the number and percentage of flags added is given in table 1.

Table 1: List of dates and number of records for each cruise.

CTC	Dates	Number of Records	Number of Values	Number of Flags	Percen- tage Flagged
AR_18_ 02	08/23/93 - 09/11/93	427	4270	330	7.73
..... AR_18_/ 					

continuous periods of time, often many days. This could be a result of the ship sailing through fog during these periods. This could also be a result of the sensor being less reliable at low temperatures or malfunctioning in some way. Thus these data points were flagged with the “K” flag. No metadata regarding this problem was available to the analyst at the time of this writing.

The only other notable problem is with the RAD data. What seems to be an instrument calibration problem caused some of the observations to be less than 0.0 W/m^2 . These observations were flagged by the prescreener with the “B” flag. The flags were left as an indication of this problem.

No other problems exist with this data set. However, the DQE noted 2 interesting data points. Both of the “I” flags were assigned to SPD for peaks in periods of extraordinarily high wind speed during the AR_18_/04 cruise. Each period lasts for a day or more, with the first event peaking at 20.5 m/s on 9/20 at 1800

and the second event at 21.5m/s on 9/22 at 1500. Pressure data does not indicate the presence of major storms. Nor does climatology indicate that these wind speeds are typical. One explanation is that these are katabatic winds from the coast of Iceland. Temperature and humidity data offer inconclusive support for this explanation. No other data is available to support additional theories.

Final Note:

As stated above, these data are in very good condition. If the user is careful with the RH data and the RAD data, this set should present no problems.
